

BrightlyFuture single post layout: what each numbered part does

1. **Breadcrumb** (Home > Category > Post). Helps users and Google understand site structure; add BreadcrumbList schema (Rank Math does it).

3. **Byline with E-E-A-T**: author photo + name (links to author page), "Fact-checked" badge, published AND updated dates, reading time.

5. **Quick Answer box** right under the image: the 45–50 word answer for featured snippets and AI Overviews.

7. **Collapsible table of contents** (mobile). On desktop the sticky sidebar TOC (12) does this job.

9. **In-article tool box** placed where the reader needs it, e.g. "Check your readability" inside a readability section.

11. **Key takeaways + FAQ** (FAQ answers not repeated from the body), then the **author bio box** and **related posts from the same cluster**.

13. **Sticky sidebar**: table of contents that highlights the current section + one tool + ad slot 2. Latest posts go low, not at the top.
2. **Category label + H1**. One H1 only. Category links to the cluster's category page.

4. **Featured image** 1200×800 WebP, with caption. Loads eagerly (it's the LCP element).

6. **Disclosure line** (affiliate / AI use) just before the content. Short, honest, links to Editorial Policy.

8. **Ad slot 1**, after the intro, never above the Quick Answer. Reserve the height so the page doesn't jump (CLS).

10. **Proof block**: real Search Console screenshot with caption. Your strongest Experience signal.

12. **Cluster hub box** (your ExerciseMenu "Training Hub" idea, improved): pillar first, every spoke listed, current article highlighted.

14. **Mobile**: sidebar drops below the article; hub box and TOC move to the top of the content area.

10 Best AI Blog Writing Tools in 2026

Featured image · 1200×800 WebP · loading="eager"

Ten AI writing tools tested on real blog posts. Prices checked October 2026.

Quick Answer: Claude is the best AI blog writing tool for drafting because it follows long briefs more reliably than ChatGPT or Gemini. For SEO, NeuronWriter (\$23/month, \$19 billed yearly) offers NLP content scoring at under half Surfer's price. Most solo bloggers need one writer plus one SEO tool: about \$39 a month.

This post may contain affiliate links; they never change my rankings. Drafted with AI help and reviewed by me. [How I test and write.](#)

► In this guide (8 sections) ▼

Nearly every blogger uses AI now. Orbit Media's 2026 survey found that 92.4% use AI for blogging, yet using AI doesn't improve results on its own. The tool you pick, and how you use it, makes the difference.

Which free AI writing tools are best for bloggers?

Claude, ChatGPT and Google Gemini cover most of what a solo blogger needs without paying anything. Grok and Perplexity fill gaps in research and real-time data.

Claude (Anthropic)

Best for	Free tier	Paid
Long-form drafting	Yes, with limits	Pro \$20/mo

Claude is my first choice for blog writing. It's the only tool I've used that reliably follows long, multi-step instructions...

11

Key takeaways

- Claude for drafting, one SEO tool for scoring.
- About \$39/month covers most solo bloggers.
- No tool replaces editing and fact-checking.

How to Humanize AI Content

ExerciseMenu vs BrightlyFuture: what changes and why

1. **Hub box moves to the top of the sidebar** (ExerciseMenu had it below Latest Posts, where few people see it). It's your most valuable internal link.
2. **Hub box lists every article** in the cluster with the current one highlighted, not just a button. Readers see the path; Google sees the cluster.
3. **Latest posts move down.** Random recent posts don't help the reader of this article; cluster links do.
4. **Sticky table of contents** in the sidebar replaces empty space on long articles and keeps readers moving.
5. **Author byline adds role + "fact-checked"** and keeps both dates (ExerciseMenu showed both; keep that). Add an author bio box at the end.
6. **"No Comments"** in the byline adds nothing. Hide it until you have comments.
7. **Tooltip-style inline links** (the boxed "medicine ball" link) look like ads to some readers. Use plain underlined links in the text.
8. **Ads:** max 2–3 per post, never before the Quick Answer, always with reserved height. Content first is what AdSense reviewers want to see.

Technical checklist for every post

1. **Schema:** Article (author = Person with sameAs links), BreadcrumbList, FAQPage. Rank Math handles all three.
2. **Speed:** WebP images, width/height set, lazy-load everything below the featured image.
3. **One H1**, then H2 → H3 in order. No skipped levels.
4. **Content width** 680–760px for comfortable reading; body text 17–18px.
5. **URL:** /blog/post-slug/ (set permalinks before publishing).
6. **Dates:** change "Updated" only for real content changes.
7. **Mobile:** TOC collapsible at top, sidebar below, no sticky ads covering text.
8. **Links:** every post links to its pillar (hub box + in text), 2–3 related spokes and one tool.
